

STEP-BY-STEP VISUAL GUIDE

How to Trade Signal Vision on Deriv

A complete walkthrough from reading signals to placing your first trade on Deriv's synthetic indices platform.

STEP 1

Open Signal Vision Dashboard

Go to **my-project-psi-topaz.vercel.app** in your browser. Wait about 15-30 seconds for the dashboard to connect and collect tick data from Deriv's servers. You will see 10 signal cards appear, one for each volatility index. Each card shows a real-time analysis with a confidence percentage, prediction, and countdown timer.

- **What to look for:** Only trade on cards showing the green **TRADE NOW** pill. Cards showing WAIT (gray) or PREPARING (yellow) mean there is no statistical edge right now. Skip those.

Pick the **trade type tab** at the top that matches what you want to trade: Matches/Differs, Even/Odd, Over/Under, or Rise/Fall. The signals change based on which tab you select, because the prediction engine analyzes different patterns for each type. Focus on one tab at a time rather than switching constantly.

STEP 2

Create Your Deriv Account

Open **deriv.com** in a new browser tab. Click **Sign Up** in the top-right corner. You can register with your email address or use a Google/Facebook/Apple account for faster setup. Complete the identity verification step by uploading a government-issued ID and proof of address. This is required by Deriv's regulators before you can trade real money.

- ★ **Start with a Demo Account.** Deriv gives you a free \$10,000 virtual money demo account. Use this to practice matching signals to trades before risking any real money. You can switch between Demo and Real accounts from the account dropdown in the top-right corner of the Deriv platform.

Once verified, you will have access to both a **Real Account** (your actual funds) and a **Demo Account** (virtual money for practice). Always test your strategy on Demo first. The prediction accuracy badge on each Signal Vision card tracks real hit/miss ratios, so monitor those numbers before committing real capital.

STEP 3

Navigate to Synthetic Indices

On the Deriv platform, click **Trade** in the left sidebar, then select **Synthetic Indices** from the market categories. You will see all the volatility indices: Volatility 10, 25, 50, 75, and 100 (available in both regular and 1-second versions). These are the exact same indices that Signal Vision monitors.

Click on the **same volatility index** that the Signal Vision card shows. For example, if your signal card says "Volatility 25" with a MATCH 7 prediction, click "Volatility 25" on Deriv. This is critical: the signal is index-specific, so trading on a different index will not match the prediction.

STEP 4

Select the Correct Contract Type

After selecting the index on Deriv, you need to choose the contract type that matches the signal. The contract picker is the dropdown at the top of the trading panel. Click it to see all available contract types, then select the one that corresponds to your signal. Here is the exact mapping:

SIGNAL VISION SHOWS	SELECT ON DERIV	WHAT IT MEANS
MATCH 7	Digit Matches	Last digit of the price will be 7
DIFFER 3	Digit Differs	Last digit will NOT be 3
EVEN	Even	Last digit will be 0, 2, 4, 6, or 8
ODD	Odd	Last digit will be 1, 3, 5, 7, or 9
OVER 4	Over/Under → Over	Last digit will be higher than 4
UNDER 5	Over/Under → Under	Last digit will be lower than 5
RISE	Rise/Fall → Rise	Next tick price will be higher
FALL	Rise/Fall → Fall	Next tick price will be lower

For **Digit Matches** and **Digit Differs**, you also need to set the predicted digit on Deriv. After selecting the contract type, a digit selector (0-9) will appear. Enter the digit number that Signal Vision shows. For **Over/Under**, set the barrier digit (the number after OVER or UNDER) in the barrier field on Deriv.

STEP 5

Set Duration and Stake

In the trading panel, set the duration to match the signal's recommendation. Signal Vision shows "**3 ticks**" or "**5 ticks**" as the recommended duration. On Deriv, change the duration type from "Seconds" to "**Ticks**" using the dropdown, then enter the matching number. This tells Deriv how many price updates (ticks) to watch before deciding if you won or lost.

\$1.00

Payout

\$9.50

Buy Contract

! **Keep stakes small while testing.** Start with 0.35 or 1.00 per trade. A Digit Matches contract with 3 ticks typically pays around 7-9x your stake, so a 1 trader returns roughly 7-9 if correct. But the base probability is only 10% for matching a specific digit, so expect many losses. The signal's confidence percentage is your edge estimate, not a guarantee.

STEP 6

Time Your Entry

Each signal has a **countdown timer** (the green/yellow bar on the card). The pattern the engine detected is freshest at the start of the signal window and decays over time. You want to enter your trade **as early as possible** after a signal appears. The card shows how many seconds are left before the signal expires and a new analysis runs.

✗ **Do not enter if less than 3 seconds remain.** The statistical edge has decayed significantly by then. Wait for the next fresh signal instead. Rushing late entries is the most common mistake and will lose you money faster than random trading.

The **"Enter in X ticks"** field on strong signals tells you the optimal entry point within the signal window. "Enter in 1 tick" means place your trade immediately. "Enter in 2 ticks" means wait one tick (watch one price update), then enter on the second tick. This timing accounts for micro-patterns the engine detects in the most recent data.

STEP 7

Click Buy and Monitor

Once everything is set correctly (contract type, digit/barrier, duration in ticks, stake amount), click the **"Buy Contract"** button on Deriv. The contract opens immediately and Deriv starts monitoring ticks. You will see a live countdown showing how many ticks remain. The contract resolves automatically when the tick count reaches zero.

While the contract is active, **do not close it manually**. Let it run to completion. The outcome depends on the final tick's last digit (for digit contracts) or the final tick direction (for Rise/Fall). Deriv shows the result instantly: you either win the payout or lose the stake. There is no partial win or early exit for tick-based contracts.

After the contract settles, check the result against what Signal Vision predicted. Over time, the **trust badge** at the bottom of each signal card will update with your real accuracy: showing how many predictions were correct out of the total. If the badge turns red and says "Accuracy below random," stop trading that particular symbol or contract type until the patterns improve.

Risk Management Rules

Maximum \$1-2 Per Trade While Testing

While you are learning and verifying the signal accuracy, never risk more than \$1-2 per trade. Even if a signal shows 75% confidence, that is an estimate based on statistical patterns, not a guarantee. Synthetic indices are pseudo-random number generators, and patterns can shift without warning. Small stakes mean a losing streak will not wipe out your account.

Stop After 5 Losses Per Session

Set a hard daily loss limit. If you lose 5 trades in a row, close the platform and walk away. Losing streaks happen with any system, and chasing losses by increasing your stake is the fastest path to blowing your account. Come back later when the market patterns may have shifted.

Only Trade Strong Signals (72%+)

The Signal Vision dashboard shows three strength levels: Strong (72%+ confidence, green border), Moderate (62-71%, yellow), and Weak (below 62%, shown as WAIT). While testing, only trade Strong signals. These have the highest statistical edge and the best backtest validation. Moderate signals can be profitable but require more discipline and smaller stakes.

Check the Trust Badge Before Every Trade

Each card's trust badge shows live accuracy tracked from real predictions. If it says "Live: 3/20 (15%)" for a Matches signal, that means only 3 out of 20 predictions were correct. For digit matching, random chance is 10%, so 15% is only marginally better. If the badge turns red with "Accuracy below random," do not trade that symbol until accuracy improves.

! **Never invest money you cannot afford to lose.** Synthetic indices are designed for entertainment and speculation. There is no guaranteed winning strategy. The prediction engine detects short-term statistical patterns in pseudo-random data, but these patterns are not reliable enough to serve as a primary income source. Treat this as a learning tool, not a money-making system.

QUICK REFERENCE

Complete Signal-to-Trade Workflow

1 Open Signal Vision and wait for LIVE status

The green LIVE badge in the header means data is streaming. Wait 15-30 seconds after loading for tick data to accumulate.

2 Find a TRADE NOW card with 72%+ confidence

Look for the green TRADE NOW pill, Strong label, and a confidence ring at 72% or higher. Check the trust badge shows decent accuracy.

3 Note the symbol, prediction, and duration

Write down: which index (e.g., Volatility 25), what the signal says (e.g., MATCH 7), how many ticks (3 or 5), and seconds remaining.

4 Open Deriv, select the matching index and contract

On deriv.com, go to Synthetic Indices, click the same volatility index, pick the correct contract type, set the digit/barrier, and set duration to Ticks.

**5****Set stake to \$1, check seconds left, click Buy**

Only enter if the signal has 5+ seconds remaining. Click Buy Contract and let it run to completion. Record the result.

**6****Wait for the next signal, track your results**

After each trade, the trust badge updates. After 20+ trades, you will have a real accuracy number. Use this to decide whether to continue or adjust.

Start Small. Stay Disciplined.

Use the demo account first. Track every trade. Only increase stakes after 50+ trades show consistent accuracy above random chance. This tool analyzes patterns, but no system can predict pseudo-random numbers with certainty.
